What I learned this week	1
Code notes	1
Topic 1	2
Topic 2	2
Topic 3	2
Things I want to remember	2
Questions I still have	2

What I learned this week

Write a short summary of the main ideas from this session. A few sentences is fine. These are your notes, so Japanese is also completely okay!

Code notes

Use the sections below to paste in code from the lesson and add your own notes. Feel free to rename the headings to match the topics you're covering.

!

Topic 1

What does this code do? Write notes / comments above or below the code chunk

```
# Paste your code here
```

Topic 2

What does this code do? Write notes / comments above or below the code chunk

```
# Paste your code here
```

Topic 3

What does this code do? Write notes / comments above or below the code chunk

```
# Paste your code here
```

Things I want to remember

Anything that surprised you, a useful trick, or something you want to look up later.

 -
-

Questions I still have

Anything you didn't understand or want to ask about next session.

 -
-

💡 Rendering tips

Render to HTML (recommended): Click the **Render** button in RStudio, or run:

```
quarto::quarto_render("my-notes.qmd", output_format = "html")
```

Switch format: Change `html` to `pdf` or `docx` in the YAML above, or render all formats at once by removing the format specification and using:

```
quarto::quarto_render("my-notes.qmd", output_format = "all")
```

If a code chunk stops the document from rendering, add `#| eval: false` at the top of that chunk to skip it:

```
```{r}  
#| eval: false
code_that_causes_an_error()
```
```

Or turn off evaluation for the whole document by adding this to the YAML:

```
execute:  
  eval: false
```
